

# Fundamentals of Nursing Laboratories

## Objectives:

The College of Nursing consistently strives to enhance the academic and practical levels of its students as part of its vision and mission, which align with the university's broader vision and mission. To achieve this, nursing and medical laboratories have been established within the College of Nursing. We spare no effort, within the available resources, to equip these laboratories with all the tools and facilities required to achieve the following educational and training objectives:

- 1 .To allow students to practice skills on mannequins and simulators before applying them to patients, adhering to the ethical principle of prohibiting human experimentation.
- 2 .To provide a variety of skills and practical applications that students can test and experience.
- 3 .To enable students to make mistakes and experiment multiple times until mastering a skill.
- 4 .To prepare students and equip them with the necessary skills to navigate their professional lives, supported by the theoretical knowledge required for success.
- 5 .To offer a quiet, safe, and clean learning environment, away from the noise and overcrowding of hospitals.

6 .To protect students from many risks they might encounter during practical training in hospitals, which often result from a lack of experience and skills. The laboratories address these gaps effectively.

7 .To foster self-confidence among students, enabling them to enter the professional world equipped with the skills essential for success.

8 .To facilitate the learning of skills that require privacy in an easy and efficient manner, minimizing discomfort for both the student and the patient.

9 .To conduct examinations and evaluate students easily and efficiently in the laboratories, avoiding the challenges and discomfort associated with performing exams on patients.
